

23 October 2023

Dear Dr. Reyes,

I am referring my patient, Jacob Davis (DOB: 11/24/2015), for assessment and management of croup symptoms.

Jacob has had 2 episodes of croup in the past 3 months presenting with barking cough, inspiratory stridor, and hoarse voice. Symptoms last approximately 5 days and have not required hospitalization so far. However, his mother states the last episode was more severe.

Past medical history is significant for asthma, managed with albuterol as needed. He has no other medical concerns and is up to date on immunizations.

I appreciate you evaluating Jacob for recurrent croup and providing recommendations for preventative management. Please let me know if any other information would be helpful.

Thank you,
Dr Little
